About Monday Morning

Monday morning is a weekly E- CAS (Electronic Current Awareness Service) of RMRC Library, Bhubaneswar which carries one Biomedical & health science news item and some useful current medical research links so that the scientists can access the articles. This E- Bulletin starts its journey from 21st Nov. 2016. In this maiden attempt we cordially invite your inputs and suggestions to improve in future.

Dr. Banamber Sahoo, Lib & Inf. Officer
Poonam Singh Deo & Hemanti Mahali (Lib. Trainee)

Nanoparticles could help rescue malnourished crops

PLANT 911 To help sickly plants get healthy and green (like these pictured), synthetic nanoparticles are the sugar that helps fertilizing medicine go down.

1. What we know about the Ebola outbreak, and the vaccine that might help

Ebola has reemerged. The virus has killed at least 25 people since early April in an ongoing outbreak in Congo. And on May 18, the World Health Organization declared a “high” public health risk in Congo, as well as a “high risk” of the disease spreading to neighboring countries, but stopped short of declaring a global public health emergency. For more details click on the below link.

2. Seventy-First World Health Assembly update, 23 May

Delegates to the World Health Assembly heard today that the next few weeks would tell whether the Ebola outbreak in the Democratic Republic of the Congo would continue to expand to urban areas or could be kept under control. Vaccination of high-risk populations began earlier this week in the affected area of the country, a densely forested area covering hundreds of kms and which is largely without roads or electricity. For more details click on the below link

3. Nipah virus outbreaks in the WHO South-East Asia Region

Nipah virus (NiV) encephalitis is an emerging infectious disease of public health importance in the WHO South-East Asia Region. Bangladesh and India have reported human cases of Nipah virus encephalitis. Indonesia, Thailand and Timor-Leste have identified antibodies against NiV in the bat population and the source of the virus has been isolated. For more details click on the below link

4. One Egg A Day Can Keep Heart Diseases At Bay

Doctors and people alike are still quite speculative about their consumption, especially if you suffer from higher cholesterol levels. However, despite being rich in cholesterol several studies off late have also proven that eggs do not really increase the risk of cardiovascular diseases (CVD). In fact, the most recent study published in the journal Heart, found that people who ate an average of one egg per day had a lower risk of developing heart disease. For more details click on the below link
